

Finals Lab Task 4. Designing Interactive Reports in Power BI

Description:

This task focused on designing interactive Power BI reports using different visualizations, slicers, filters, and formatting tools. A three-page report was created to present sales and performance data through charts, matrices, cards, and dashboards.

The activity included organizing report layouts, configuring visual properties, syncing slicers across pages, and applying filters to improve user interaction and data analysis. The completed report was then prepared for publishing and presentation using the Power BI service.
